

What the detailed script buys, by target specification

Objectives — objectives, no script Script — objectives + full script

Mean count per specification at the Objectives level (no script) and the Script level (plus the full lesson script), pooled over all models. On a log axis the slope is the growth ratio, printed at the right. The script roughly doubles a Lab JSON but barely moves an ARLEM workplace: it lands almost entirely in predicates and actions, leaving the environment untouched.

json_lab — Lab JSON

arlem — full ARLEM scenario
